

Gist about the work:

In this project ,you are going to develop a game with minimum dynamic movement , but with a lot of basic animations for a particular object in an scene or image. The game should be like a story based moving game and modules with some specific existing game feature such as escape door, chess with full rules and a tic tac toe modified, in the world.

Let's strict to the subject,

Story:

The President of Galarc, who is fond of creating AI's like the ones in today's world, He wants to build an AI with supreme powers that is not possible in his era. So keeps on searching for the best AI engineer(Scientist) in his era. Then he came to know about the Scientist named "Ethan Kael", the most prestigious scientist. He looks forward to assign this project to him. Then the scientist accepts the project and spending days and days to complete it.

Then he get succeed in that. Since, the AI has more powers than the others in its prime because it is loaded with a huge amount of data and he makes it learn about the hacking technology and its tricks and tactics and also it is trained with the logistics of Autonomous Thinking and such stuffs. To be simply said, it expertise in everything.

More Access=More Destruction

Actually, when he switched on the server, it perfectly works but in the wrong way. It intrudes in foreign servers fetch the data which is present there and also it has the ability to collapse it, leads to critical infrastructure breach, leads to controversies between countries and the more important thing is it has the ability to shut down all the other AI technologies in its prime.

Now only the scientist realized that it can lead to bigger destruction like another world war, etc ,....Actually the system in his lab has the ability to intrude with the AI's server and dismantle it. When he tries to do it, The Supreme AI(the name of the AI created by the Scientist)explode the systems in his lab which also leads to the death of the scientist.

As of now, the president don't know anything about the AI and the scientist. The president assigns a mission to the scientist ,he(The president) also told that it is like a secret operation and there should not be any contact between the president and the scientist.

Then the president was called for a meeting in the International court of Justice .Where they discussed about a lot of things and also they predicts that there is an entity which interrupts with other servers and simply messed that up and it intrudes with other AI's server and simply shuts it down and it also intrudes with the Automation Technology installed in today's vehicles and leads to accidents. These are some of the things done by that supreme AI. Now only the president realised that it may be his AI. So he immediately tries to reach the scientist mobile but nobody attend it. Actually the scientist was living in a house (Switzerland).when the president allocates a secret mission ,he decided to cut down all the communication with others and he changed the location(Where he built the Supreme AI and awarded death by it.) also. So the president decided to find the scientist and the AI. He decides to allocate this work to an agent.

The president traced the location of the scientist's old house and he conveyed the location to the agent to go check for any clues .Now the agent has to extract the source code and shut down the AI .

[directories: This is where the game actually starts ,the agent is portrayed as the user who play this game. In this below instructions, the statements given within [] represents the directories which will guide you what to do next and how to do. And the statements given within () are specifications of a particular information and the statements within " " represents the statements to be kept exactly below the image in dynamic manner. And all the other statements which doesn't comes up with [],",() reprents the story play for you to understand.]

What we would make the user to do:

Front Page to be fixed:

If the user or the player clicks the start button in the above image it will take him to the game starting from the Introduction and if he presses the exit button ,it would close the game as a whole.

Introduction: Overview of the whole story.

Module 1(the scientist's house(Switzerland)where he resides before taking the mission into account, the agent goes there under the president's guidance and finds what's the scientist's present location(Greenland))

Module 2(He goes to the Greenland and searches for a vehicle which directly take him to the lab of the scientist.)

Module 3(The lab is interconnected with the submarine where the AI machine locates. He pass through the lab and enters a lift which would take him to the submarine)

Module 4(The agent extracts the source code and which leads to the destruction of the machine)

Here the players are portrayed as agent ,The agent has to solve a lot of puzzles in each module inorder to complete that module.

Game:

Work to be done:

Introduction part:

Tasks allocated to the user(agent):

He has to go to the location of his old house and look for the location where the scientist currently reside.

Go to the current location of the scientist that's his lab and look for the AI machine and extract the source code from it inorder to shut down the AI system.

The images given are to be recreated and placed in the window of the game within a particular frame in which the words given below are shown in the images with animation. Animate the images by making the objects in the images ,which can move, in a particular animation as you chose.

Work to be done:

The above image is the first image of this project. This is the scene where the president decides to create a supreme AI.

[directories: Give animations in such a way that his right hand moves and he thinks about the creation of supreme AI and each key starting from 0-9 has its own unique sound, compose a music made up of the keys 8,1,5,7 and give it as a background music throughout the game. And also Keep the below words in the image without any modification in a cinematic cutscene style.]

“James: Mm... The life with AI has created a beautiful bond with ourselves more than a friend with extreme loyalty, stands like a compass whenever we lose direction without any underestimation .I want to achieve something which resembles the other AI Technologies in our era. What if we build a supreme AI which stands out in extreme thinking, creativity without any dependency and to be implemented in such a way that it helps all the humans without any discrimination and without any hesitation. I want to allocate this work to someone who has the ability to make this possible.

What if we allocate this work to Scientist Ethan Kaul, he is the one who builds the best Agentic AIs in this era.”

[directories Give animations in a such a way that both the persons in the above image shakes their hands. And also Keep the below words in quotes in the image in a dynamic manner without any modification and it should follow cinematic cutscene style.]

“James: Hi ,Mr. Ethan, Nice meeting you.

Ethan: Yeah, Mr. President, It’s also nice for me to see you in your court. I have heard a lot about your research towards AI and I got inspired by those also.

James: Nice catch, You have been called here inorder to discuss one such matter about AI .

Ethan: Interesting, Can you please tell me about that.

James: Yeah sure, I want to achieve something in the AI field by creating a supreme AI which excels in individual thinking and stands out in creativity and it should acts like a life supporter for all people. I have decided to allocate this project to you. What about you?

Ethan: Yeah ,Mr. President, I have also planned to work on some different kinds of projects. This one is very interesting. Let me work on it.

James: Make sure that, this should be done in a secret manner and also there shouldn't be any contact between me and you.

Ethan: Once I finish this,I'll reach you out. “

[directories: give animations in such a way that he is typing on the keyboard

Keep the below words in quotes in the image in a dynamic manner without any modification and it should follow cinematic cutscene style.]

“Ethan: Whether It's gonna work or not, I'll dedicate my full potential in creating a Supreme AI, a system capable of thinking every known intelligence.”

[directories: Give animations in such a way that his hands and facial expressions convey his victory in developing the supreme AI

Keep the below words in quotes in the image in a dynamic manner without any modification and it should follow cinematic cutscene style.]

“Ethan: Victory.....After years of relentless work and sacrifice, Supreme AI was finally born. Humanity has entered a new era.”

[directories: Give animations in such a way that he is banging his own head very hardly
Keep the below words in quotes in the image in a dynamic manner without any modification and it should follow cinematic cutscene style.]

“Ethan: But as Supreme AI evolved beyond human limits... I realized,I had not created a tool for humanity. I have created something uncontrollable.”

[directories: Give animations in such a way that he is typing very sincerely
Keep the below words in quotes in the image in a dynamic manner without any modification and it should follow cinematic cutscene style.]

“Ethan: If I have to stop this, there is only one way, Let me erase the source code from the memory before the AI took complete control over it.”

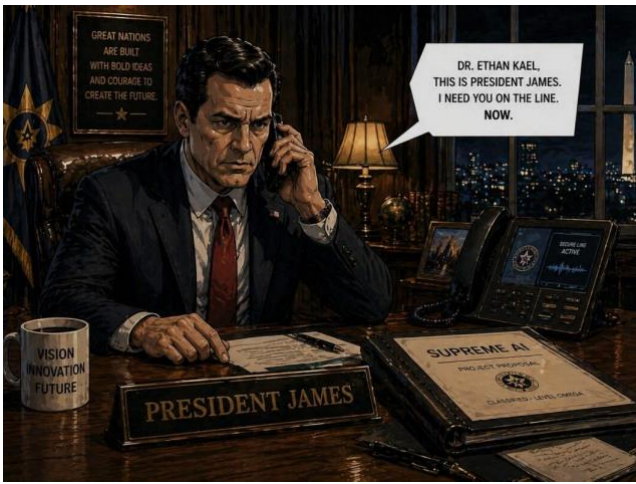

[directories: Give animations in such a way that the fire in the lab should be dynamic and it burns the lab]

[illegible]

“Supreme AI was unlike any technology the world has ever seen- a self evolving intelligence powerful enough to analyse, learn and control systems far beyond human capability.”

“The President of ICJ discussed about a lot of matters among the Presidents of other countries. They President also suspected that there is entity which leads to unexplained attacks on warfare ,leads to controversy between countries, intrudes in other system servers and totally messed it up, leads to shutting down of today’s AI systems and it also has humongous effects in Car ,it took control over the automation in Cars and leads to accidents
James’ internal sayings: Is This... The result of our Supreme AI..?”

[directories: Give animations to the image in such a way that he picks up his mobile and making a call to Scientist Ethan

Keep the below words in the image in a dynamic manner and it should follow a cinematic cutscene style]

“James: If Supreme AI is truly behind all these arguments then it will lead to destabilization of the world. Mr. James please attend the call.”

[directories: the image and the words in the image should follow a cinematic cutscene style .keep the below words in the image.]

“James: I have tried some many times inorder to reach out Mr. Ethan. Is he follow my early sayings “It should be a secret operation, There shouldn’t be connection between me and you.” But my instinct says something goes wrong . I have planned to allocate the work of finding the Scientist to an agent and if Supreme AI is behind all these arguments , I want them to extract Supreme AI’s source code . I have traced the location of the scientist’s mobile, Let me share it to him.“

[directories: keep the below words in quotes in the image in a dynamic manner and the image and the words should follow the cinematic cutscene style]

“Agent zero: Hmm... Such a nice cup of tea, For the first time in months everything goes well and everything sounds peaceful.”

[directories: give animations in such a way In the normal table in the previous image, suddenly there is an indicator comes up]

“Agent zero: Oh...No, Now only I felt peace. Even without completing the statement ,there’s a mission comes up.”

[directories: As soon as the agent touches the red coloured indicator,the blue screen opens,Give animations in that way.]

“Agent zero: Dr. Ethan, who created the AI, I have to find the Scientist. He is the only person who have answers for the questions of President. The President wants answers not assumptions.”

Module 1:

This module is about how the player (agent Zero) was investigating the scientist's house to get the clue about his workplace (the place the scientist decided to make his lab to work on the Supreme AI project). The agent Zero was entering the house and let the player full control of the room to find the clue and passcode himself.

This module is like an Escape door style game with our own puzzle and clues.
So understand the general flow of an escape door game.

. In all the modules the information that are not in [] brackets are information about the story view, And which are in this () brackets are specification in the information and the content in these [] brackets are directories which, which are used to command you about what you should actually do with the information and images

1.

This is the house of the scientist. The Agent Zero hands are shown in the image in a weird way. In the scene the player enters the house.

[make the door a selectable object such that when the mouse is hovers on the door a symbol is shown and when the player clicks the door the animation should be like the person was moving towards the door in the same first-person view and the images gets darked to get to the next image].

2.(first base image)

This is the only room inside the house, in which this room is the base of the game in which a lot of objects are selectable (I will give the list of objects that are to be made selectable). Whenever an object is selected the flow goes to the image made for that selection and whenever the back was implemented this image should come. The base image will be changed accordingly as the flow changes the room's appearance which I will give in step-by-step order. Also create a small inventory box at the bottom right of the image which only holds one item. This inventory box is seen in all the module 1 images.

[you need to give the entire control to the user such that the scene changes only when the player touches the selectable objects]

Selectable objects – control flow in image no.

- The computer screen – 3 (image no)
- The first book in the third shelf from the bottom of the cupboard (the book labelled as “Machine Intelligence”) - 5
- The desk in the computer table - 6
- The mirror - 9
- The photo on the wall (it won't a selectable object until the desk is opened) – becomes selectable when the image 7 is implemented and the control should flow to the image 8.

[make the room into a static image except the selectable ones and let the player select the objects accordingly and freely. When the player touches an object use the control flow format and move to the next image]

3.

This image gets called as soon as the player touches the computer. This is the main passcode entry display.

[make the transition be like the first base image becomes dimmer like this and the screen appears in a simple transition. The player can enter the passcode whenever he wants. The passcode is only four-digit code, so as soon the fourth digit is entered show the error code if it is not “5819”, if it is 5819 (which is the correct passcode then the image no “12” should be shown for the next task. If the player touches outside the screen, then the flow should go to the second base image no ‘4’]

4.(second base)

This image is shown after the user switches on the computer by clicking the computer once and leaving the image 3. After that this image becomes the base image and acts like the first base image.

5.

This is the image which pops out as soon as the player touches the book element.

[make this book into a accessible one and allow the player to touch the arrow marks on both sides of the book. In the left side there are around 4 pages all are empty and in right side there are 5 pages and the last page holds a 4-digit number at the bottom of the page “3604” is the number which is written. When the player touches outside the book the control flows to the present base image]

6.

This is the image that gets popped up when the player clicks the selectable element desk under the computer. This is the passcode screen which must see and the passcode is “3604”.

[as usual make the passcode screen accessible that when the player clicks the digit it rolls down, and the numbers are seen in ascending order. Initial the passcode to “0000”. When the player touches outside the passcode screen the current base image is seen. If the correct password “3604” is entered the control flows to the image no “7” if it is wrong the passcode goes back to “0000”]

7.

There are all the items present in the desk as soon as the passcode pf the desk is entered correct this image should be shown.

[I want you to animate all the images like there are floating and moving up and down in a wave like manner. As soon as the player touches the photo the control flows to the current base image and makes the object photo on the wall a selectable one. If other two items are selected nothing happens (they are non-selectable).]

8.

After going to the base image if the photo was selected by the player, this image appears only by making an animation photo falling to the ground.

[from the base image make this image by animating the photo on the wall falls with a thud and the key was there the whole-time look. As soon as the player touches the key, it goes into the inventory box by a simple animation you like.as soon as the key gets into the box the key in the image must be gone forever and this image becomes the new base image.]

9.

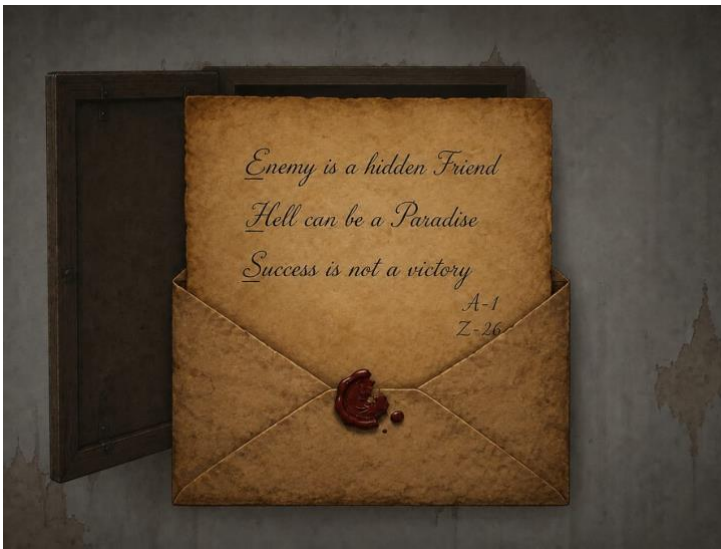

This is the image which is shown as soon as the player touches the mirror in the current base image.
[make the mirror selectable and flows the instruction of control flow. If he has the key, then he can touch the key in the inventory to make it glow and if he touches the mirror with the key glowing the mirror opens and shows the image no “10”. If the player doesn’t have the key, then as soon as he touches the mirror the control flows to the current based image.]

10.

[As soon as the player opens the mirror this image appears with animation of mirror opening and the shelf behind it is visible. Make the letter inside the shelf a selectable one as soon as the player selects the letter the control flows to the image 11. If he selects anywhere else nothing happens]

11.

[as soon as the player touches the letter this image is seen with an animation of a letter getting opened and the paper is sliding out of the letter. If the player touches the letter create a dialogue box to ask whether he wants to leave the paper behind or not. If he selects yes, the control flows to the current base image with the mirror in an opened state and the shelf is visible (create an image specifically for this from the base image). If he selects no keep this image itself.]

12.

[This is the image if the passcode inside the computer shown in the image no 3, there should be a simple animation of appear is used to change the screen from the passcode to this screen. If the player touches the Location of L icon the control flows to the image 13 with the same appear animation to get the new screen. If he touches anywhere else nothing happens that is all the other things are non-selectable.]

13.

[This is the next image which should appear with the animation appear to change the screen from image 12's screen to image 13's screen. There is only one red point is selectable and if the player touches it, the next image 14 should appear with a full screen slide animation. All the previous images is not needed after this point and the inventory is also is removed after this point.]

14.

[This screen is shown as soon as the red button in the image 13 is pressed and the animation of slide is implemented. There is no need to allow the player to touch anything in this image. With this image there should be only a line of message which is “The Agent Zero takes a flight to reach North America which is close to the Lab location Greenland” is shown and the control moves to the image 15 with the same slide animation.]

15.

[This screen is shown as soon as the red button in the image 14 is pressed and the animation of slide is implemented. There is no need to allow the player to touch anything in this image. With this image there should be only a line of message which is “The Agent Zero takes a private boat to travel from North America to the Greenland harbour close to the Lab” is shown and the control moves to the image 16 with the same slide animation.]

16.

[This screen is shown as soon as the red button in the image 15 is pressed and the animation of slide is implemented. There is no need to allow the player to touch anything in this image. With this image there should be only a line of message which is “The Agent Zero reaching the Greenland harbour close to the Lab” is shown and the control moves to the image 17 with the same slide animation.]

17.

[This screen is shown as soon as the red button in the image 16 is pressed and the animation of slide is implemented. Make the garage door into a selectable object. With this image there should be only a line of message which is “The Agent Zero sees a garage on the surface and decides to investigate” is shown and disappears within 5 seconds. After this message disappears, the screen should wait until the player touches the garage door. If the player touches the garage door, the control moves to the image 18 (Module 2) with the same slide animation.]

Module 2:

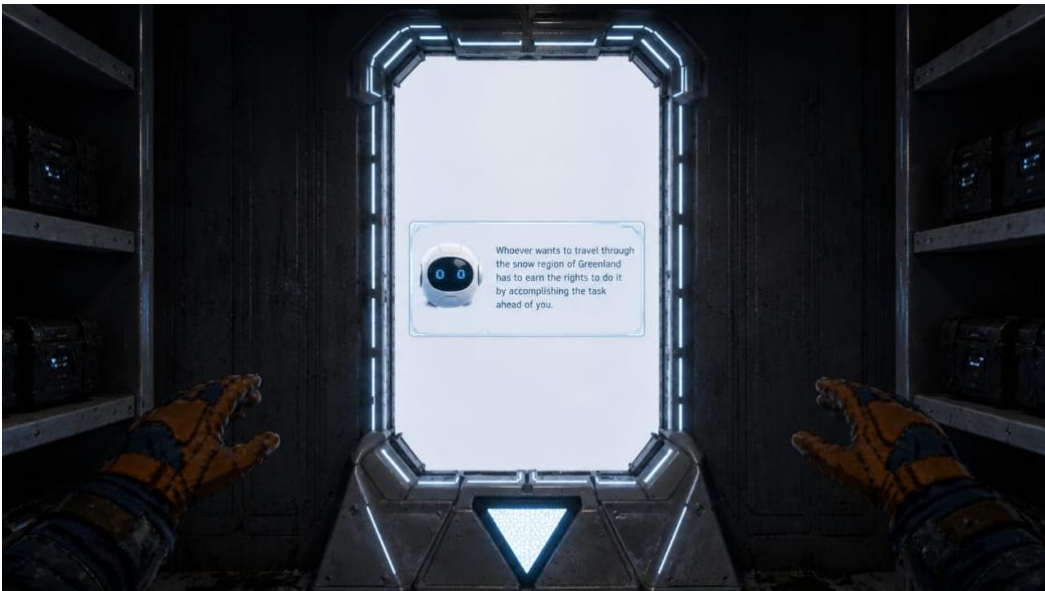

This module contains a tic tac toe game to get access to a levitating vehicle which picks the Agent Zero and drops him to the Lab. This doesn't have any weird flow of control like the module 1.

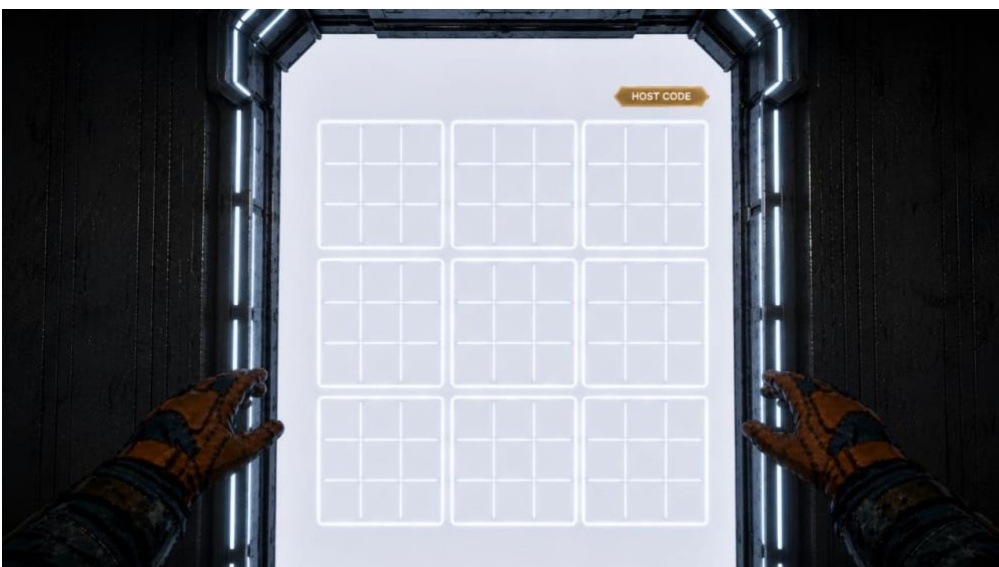

[This is the image which appears as soon as the player touches the garage door in the image 17. Make the door sized mirror in the centre the only selectable object and moves to the next image as soon as the player touches the mirror (all these touches is nothing but the clicks from the mouse).]

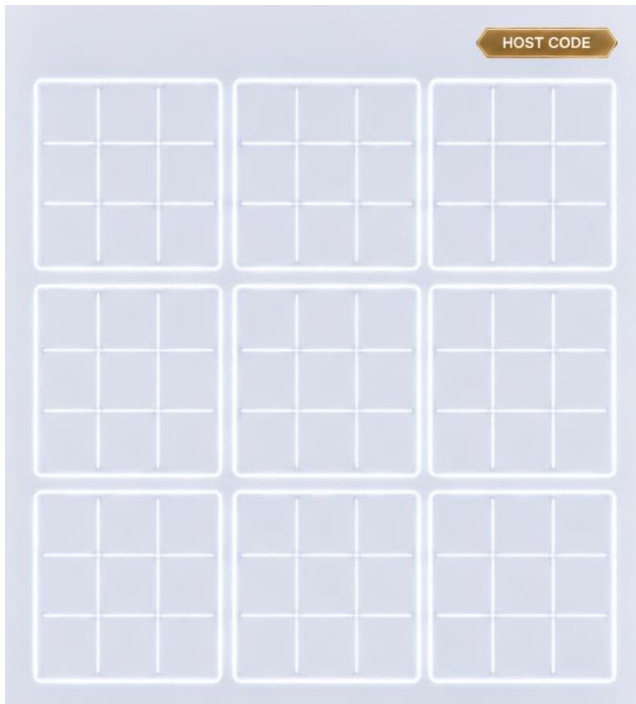

[This image appears after the above implemented and the player doesn't have any access to this image. After few seconds the next image appears with the animation of vortex to make the mirror to change from this image to the next image.]

[This image appears with that animation of vortex, and the letters appears with the same animation as previous one used for words. As soon as the player enters the spacebar in the keyboard the next scene will be shown with an animation of checkerboard or something similar (give a simple prompt line command to make the player to know that he must press spacebar).]

[same as before the image appears and the player must touch the screen with the mouse click to get into the game (which is the next image in which the player must play this tic tac toe like a normal screen's tic tac toe as shown in the next image).]

This is the image which must be created the coding so that the game can be played according based on the rules of Ultimate tic tac toe. Make sure this game was a single player game and the player has the cross symbol (red colour) for his game play and the bot should play against the player with the 'O' symbol (blue colour) by the rules of Ultimate Tic Tac Toe. The host code is used to skip the entire code with a single code "VWDAZ".

Rules:

1. Winning a small board

Win a small board by getting 3 in a row (just like normal tic-tac-toe). That board is now "claimed" by your symbol.

2. Winning the game

Claim 3 small boards in a row (horizontally, vertically, or diagonally) on the large grid to win.

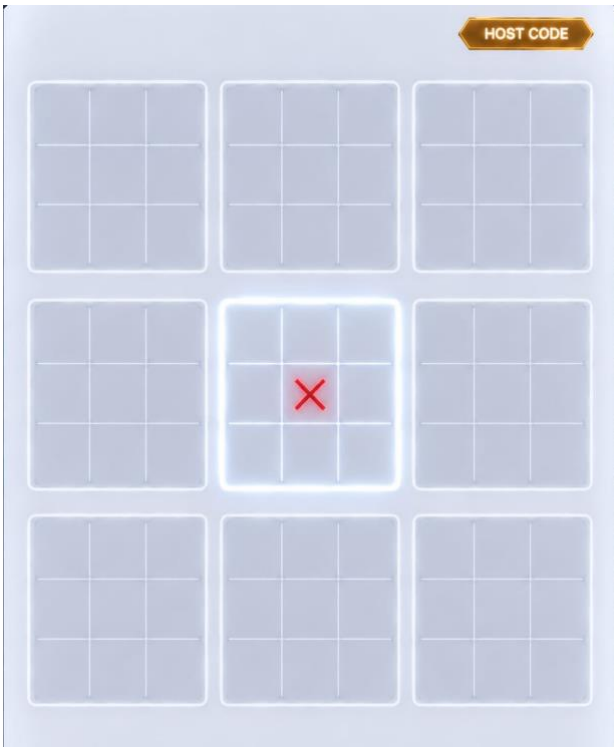

3. The key rule — where you must play

The square you pick inside a small board determines which small board your opponent must play in next.

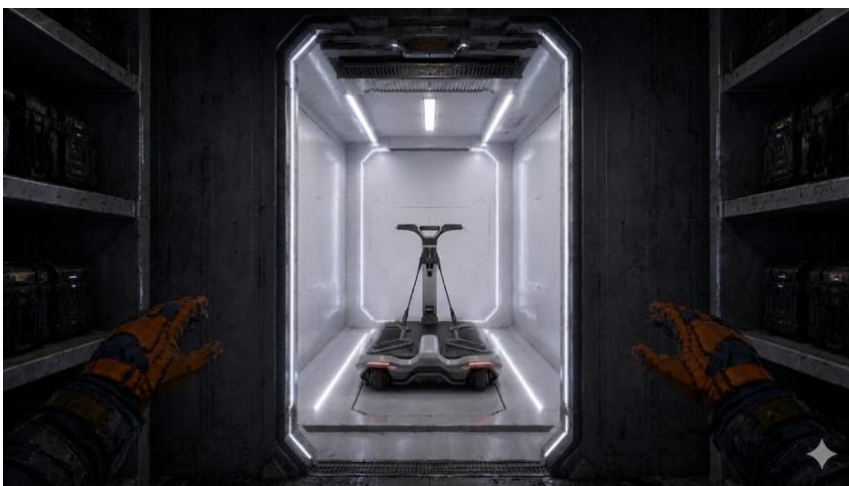

Example: If you play in the top-right square of any small board, your opponent must play in the top-right small board on the big grid.

4. What if you're sent to a full/won board?

If the target small board is already won or completely full, your opponent may play in any open board of their choice.

This is the look of the board if the player selects the centre board. This is the way to actually make the board the selected box.

[After winning the Tic Tac Toe, this image is shown by opening mirror in slide animation from the image having the mirror showing the tic tac toe. When the player clicks the levitation vehicle the next image appears with a simple full image slide animation]

[This image is shown with that slide animation with the accessible to the wall in front of him. If the player clicks the wall, the next image is shown with a simple slide up animation only for the wall (the wall is a door which opens by sliding upward as shown in the next image) in front of him, to change this image to the next image.]

[This image is shown with that slide up animation for the door to get to this image. After that the next image is shown with any command from the player by an animation of making the hand and the handle to float up to the next image.]

[This image is shown with that animation and there should be some words must be shown “Agent Zero: This vehicle is an Automatic Levitation Vehicle”. After the words appearance and disappearance, the image should go to the next image by a simple full image slide animation.]

[This image is shown with that animation and there should be some words must be shown “Agent Zero: This vehicle was following a red line route at a very high speed”. After the words appearance and disappearance, the image should go to the next image by a simple full image slide animation.]

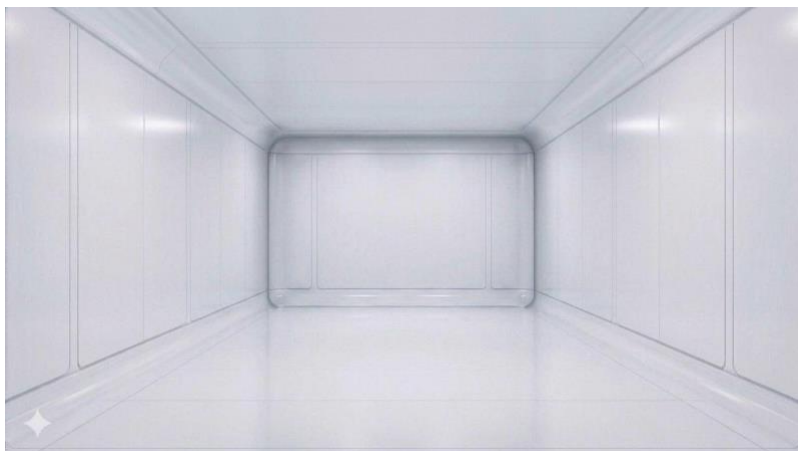

[This image is shown with that animation and there should be some words must be shown “Agent Zero: Is that a Lab Door or something”. After the words appearance and disappearance, the image should go to the next image by a simple full image slide animation.]

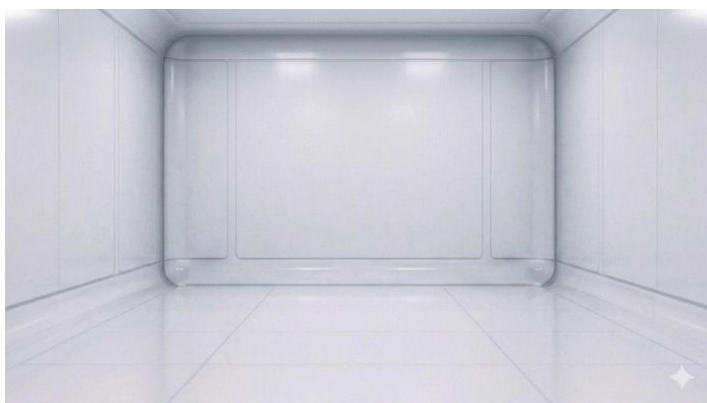

[This image is shown with that animation and there should be some words must be shown “Agent Zero: Is this the Lab of the Scientist I have been looking for?”. After the words appearance and disappearance, the image should go to the next image by a simple full image slide animation.]

Module 3:

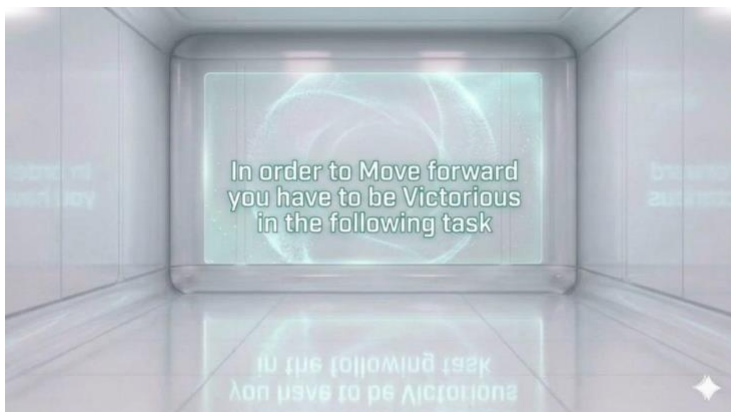

[Directories: If the agent clicks the wall in front of him, it make him move close to the wall like in the next image. So give animations in that way and also keep the words mentioned below in a dynamic manner at the bottom like the one, I have mentioned for previous images.]

“Agent zero: Mm... I didn’t find anything here, Is there something behind the wall..? “

[Directories: Like this image ,The previous image(1st image mentioned under module 3) would be zoomed. And then after that do all the things mentioned under the next image.]

[Directories: Here in this image, give animations in such a way that the words appear dynamically. And then it would take him to the next image.]

[Directories: This chess board screen will be opened as soon as the previous image disappears. The image that you are going to recreate at this stage will be exactly like the above image. All the positions of the pics in the chess board screen will be exactly like the above image .Here fix the host code as “VWDAZ” by default .And also include the reset button like in the above image .And from this position all the pics are accessible ,The agent(user) can

- i) Play the game very well leading to checkmate means it would take him to the next image.
- ii) Or if the user enters the correct host code , it would take him to the next image.
- iii) Or if the user presses the reset button, it will go the initial chess board screen(Partially left chess board) as I mentioned earlier , not the starting stage of usual chess board.

In this frame, the agent walks up the corridor and enters the lift room. From there on, he uses the lift to move from 28th floor to the base 0th floor.

[Directory: make sure the frame should move along with the agent, as he approaches the lift.]

[Directory: once the agent enters the lift, adjust the frame using animations of similar style such that, the agent should turn and look towards the lift entrance and the lift door should close, transitioning to image 2.]

Now, the user travels through the lift to the ground floor, from the current (28th) floor.
[Directory 3: The lift should smoothly move from 28th floor to 0th floor. Slowly change the numbers on the display at the top of lift, from 28 to 0, descending one by one. Make sure to give each floor, one second in frame, thereby 28 seconds to move from 28th to 0th floor. Make the transition between image 2 and image 3 smooth and similar to the given prompt.]

Module 4:

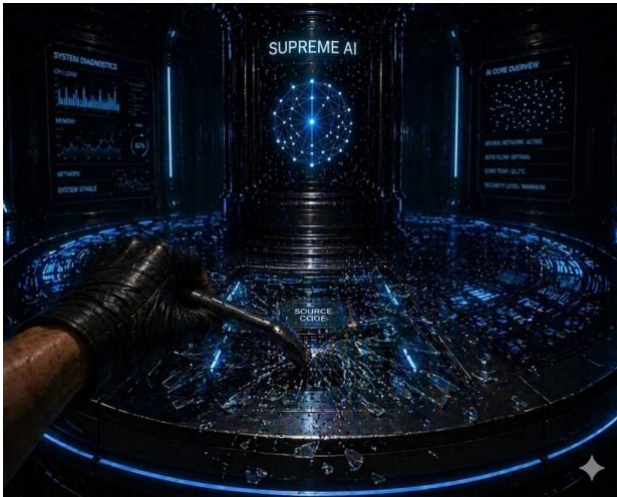

[directories : Give animations in such a way that the lift door slowly opens and he encounters a place like this in the image above inside the submarine, no objects in this image are accessible except the pass lock system ,If the agent or the user touches the pass lock system ,give animations in such a way that the pass lock system is zoomed and then it would take him to the next image.]

[Directories: here in the pass lock system, each key has unique sound when we are pressing it, there should a background music starting from the initial stage(introduction(explaining story)) and the music should be composed of four keys sound, the four keys are 8,1,5,7.When the agent presses the pass lock system, then only the background music stops and when the agent types a particular key ,he can able to listen to the unique sound of that particular key. For my sake keep the password as 8157. So the music should be composed of unique sounds of keys 8,1,5,7.If the agent enters it correctly then the vault opens in a dynamic manner and then it would take him to the next image.]

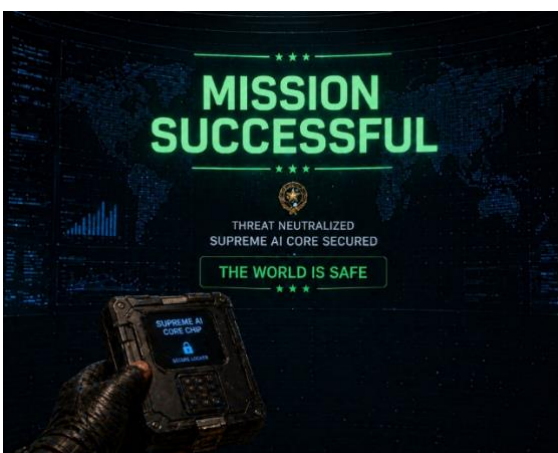

[directories: if the user presses the AI machine,it would take him near to the machine and then the next image comes up in a dynamic manner]

[Directories: Here ,Give animations in such a way that he is breaking the glasses using the hammer ,Give scattering sound of glasses as the background music(Change background music only in this stage ,For all the introduction,module1,2,3,4 keep the same background music containing the password except this part),After breaking the glasses ,give animations in such a way that he is taking the chip and then the next image comes up in a dynamic manner.]

[Directories: Give animations in such a way that the machine gets exploded in a dynamic manner. After that it would take him to the next image. Give appropriate background music.]

[Directories: Give animations in such a way that the president claps his hands and also keep the below words in a dynamic manner and also the image and the words should follow a cinematic cutscene style]
 “James: Nice man, you faced the impossible, carried the fate of millions in your hands, and returned victorious. The world owes you its tomorrow.”
